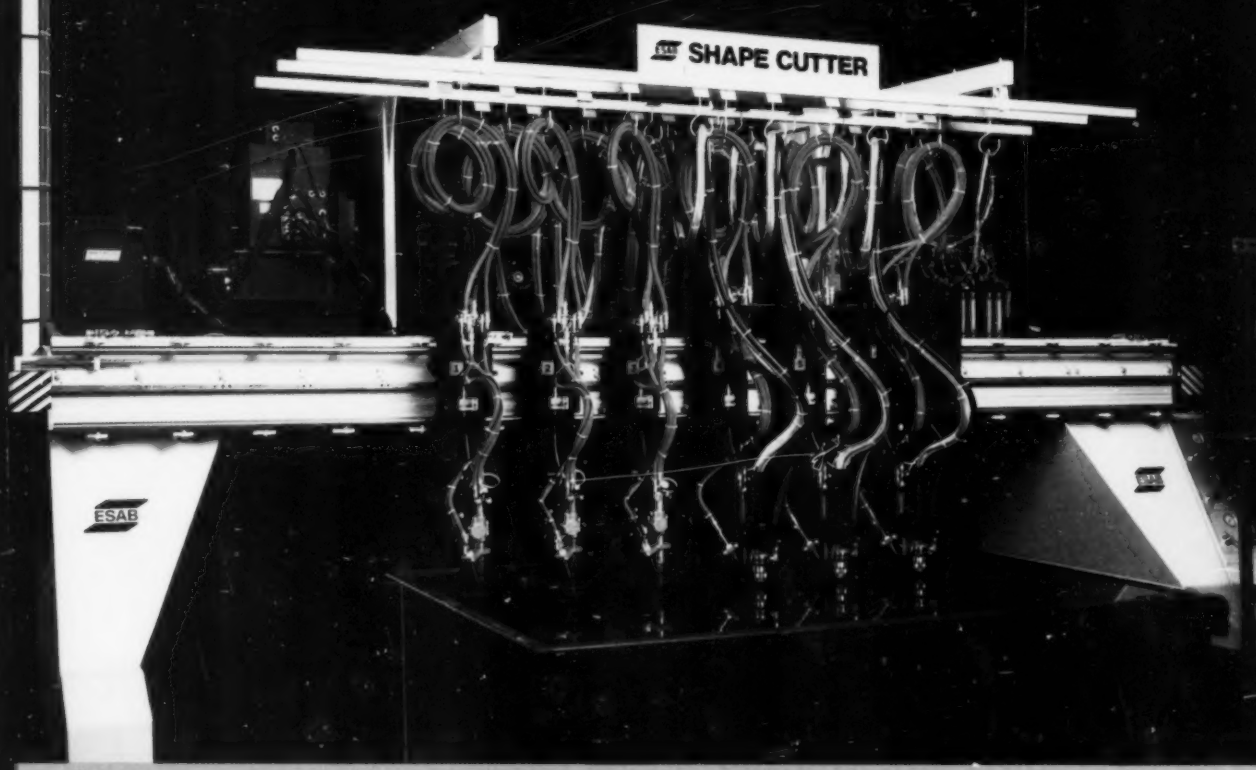
Accurate. Reliable. Built to Last.
The leading edge in cutting is sharper than ever.



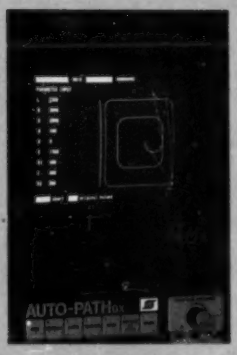
Quality equipment offers the best return on investment. It also attracts the best customers.

At ESAB, quality and ROI go hand in hand. And that adds up to customer satisfaction. That's why companies like General Dynamics, ITT, Rockwell International and General Motors select ESAB. So do hundreds of smaller companies who count on ESAB engineers and machines to keep their customers satisfied and their operations running smoothly.

Here's part of what makes ESAB a cut above the competition:

Mechanical Accuracy

- Stronger, more rigid structural components for improved repeatability and smoother operation.
- 9 axes of precise movement on up to 12 torch stations.
- Fully enclosed rack and pinion gantry drives for exact positioning.
- Exclusive round rail track system yields greater accuracy and less wear.



Auto-Path GX CNC unit with color graphics and standard shape library.

Computerized Reliability

- Torch spacing and contour bevel cutting are totally automated.
- On-board self-diagnostics reduce down time.
- CNC compatibility allows software down-loading from host computer.
- Color monitor displays single and nested shapes.

Long-lasting Service

- ESAB Applications Engineers work with you from initial engineering through installation and personnel training.
- ESAB hotline offers fast trouble-shooting capability.
- Field service reps on site within hours of your call.

For solutions to any cutting problem, look to a company that's always sharpening the leading edge. Look to ESAB.

ESAB Mechanized Cutting Division, P.O. Box 2286, Ft. Collins, CO 80522, (303) 484-1244, Telex: ITT 499 1462.

Weldsale Platens
Stands and Tooling

Simply the Best!

Designed for Convenient and Secure Set Up of Multiple Platen Beds

Only **Weldsale Platens** are designed and manufactured with **raised, machined bosses** around **slotted holes** in the skirts.

Set up of multiple platen beds with **Weldsale Platens** can be performed quickly and simply. When the individual platens are positioned perimeter edge to edge, the slots allow the connecting bolts to be easily placed and tightened.

Our **raised and machined bosses** then fit face to face, eliminating the need for any additional washers or shims, and also eliminating the possibility of cracking the platen skirts when the connecting bolts are tightened, even if pneumatic wrenches are used.

Convenient and secure multiple platen bed set-up is just one more reason why **Weldsale Platens** are ***Simply the Best!***

Custom Stands Available

For maximum flexibility in multiple platen bed configurations, we engineer and fabricate any type of custom stand arrangement required.

HOW TO CUT IT IN PLANT MAINTENANCE

NEW ARCAIR® SLICE™ SYSTEM

YOUR ALL-PURPOSE CUTTING TOOL

You name it... you can cut it

Unlike any other cutting technology, the unique new Arcair Slice System can cut, burn, melt or vaporize virtually any metallic, non-metallic or composite materials you can find in today's manufacturing, process or assembly plants.

Materials such as steel reinforced concrete. Aluminum, brass and other non-ferrous metals. Glass and ceramics. Every kind of iron. Plastics, mastics and caked-on mud or rust. Mild, stainless and alloy steels. Slag and refractory materials. Wood, of course, and brick. Even magnesium.

Handles dozens of maintenance jobs

Once you see the Arcair Slice Sysem in action, you'll think of dozens of ways to use it on your toughest cutting jobs. You'll find that it's ideal for equipment repair or plant renovation. It burns through steel girders, plaster-insulated pipe and all kinds of scrap. Removes headless bolts or frozen pins. Even cuts mud or rust-covered materials. There's never been a more versatile tool for plant maintenance.

It works like this

The Slice System uses a special torch that feeds oxygen and power to a patented Arcair Slice exothermic cutting rod. You supply oxygen and either a 12-volt battery or any welding machine. The battery gives you easy portability. The welding machine provides work station convenience and, when necessary, hotter cutting temperatures.

Either way, you simply turn on the oxygen and touch the carbon steel cutting rod to the grounded workpiece or a striker plate. The cutting rod ignites immediately.

More energy into the cut

Once the exothermic reaction begins, the Slice™ cutting rod continues to burn ... with or without electrical power ... as long as you maintain the oxygen flow.

When you use a welding machine while working with conductive metals, the cutting rod pours over 10,000° F into the cut. But even without current, it still produces temperatures hot enough to vaporize stainless steel.

Use the Slice Torch for equipment maintenance and repair.

Free booklet

Send for our informative booklet on the Slice System. You'll get all the facts about today's most versatile way to cut your plant maintenance cutting problems.

Call your local Arcair distributor. Circle the number below. Or contact us at Lancaster, Ohio 43130 **U.S.A.** (phone 614-653-5618); Downsview, Ontario, **Canada;** 9440 Erembodegem, **Belgium;** Mexico 13, D.F. **Mexico;** Kwai Chung, NT, **Hong Kong.**

For the digital measurement, monitoring, and recording of resistance welding equipment.

MIYACHI WELD-CHECKER®

Measures current/voltage at every half cycle, allowing checking of proper SCR and ignitron functioning.

Measures and prints out non-conduction degrees, to allow checking of weld transformer capacity, proper tap selection, allowance of weld current, etc.

Prints deviation of weld current and cycles from standard values at 1.8 lines/second.

MODEL MM-316A

Applications:
Single phase AC, single phase rectified, 3 phase rectified, seam (with cool time), multiple-impulse, and capacitor-discharge welders.

Here are TWO SOLUTIONS to solve your Cutting Problems

The Original Thermex Oxygen Torch

Thermex Jr. Oxygen Torch
• For limited space applications

Both torches are already in action in typical applications like Foundries and Primary Metals Cutting, Heavy Equipment Repair and Refurbishing, Mining and Castings.

TOO HOT.

You could prep weld joints with a flame cutter. But you'd have a finishing step afterward. You wouldn't be able to bevel contoured edges, aluminum or stainless steel. But you could burn up your budget in gas costs.

TOO SLOW.

You could go through the same old grind. At about 3 inches/minute. You'd have a hard time getting a uniform edge. And you'd go through a lot of grinding wheels.

Or you could use a tool that does a month's work in a day.

JUST RIGHT.

TRUMPF portable bevellers are 4x faster than flame cutting. 20x faster than grinding. They bevel a uniform edge every time.

Get the right tool. Write TRUMPF Power Tools, Farmington, Connecticut 06032.

TRUMPF
